API Functional Test Report

Quality Event Register API | Portfolio test record | Report v1.0

Test ID / result	API-TC-001 / PASS
Tester / GitHub	Fenthy Thula / afr0d8ta
Project / API version	quality-event-register-api / 0.1.0
Execution date	October 16, 2026 (America/New_York)
Method / endpoint	GET /
Environment / tool	GitHub Codespaces forwarded port 8000 / Swagger UI

Objective and scope

Confirm that the running demonstration API responds to a request at its home endpoint with HTTP 200 and a JSON status message. This record covers one successful request, based on the supplied Swagger screenshots; no new execution was performed while preparing this report.

Reproduction steps

1. Start the project and open its forwarded application URL at **/docs**.
2. Expand **GET / - Home**, select **Try it out**, then **Execute**.
3. Inspect the server response code, response body and Content-Type header.

Expected result and observed result

Acceptance criteria recorded for this report: HTTP 200; Content-Type **application/json**; a JSON body identifying the running API, a success status and version 0.1.0. All three checks match the captured response.

```
{
  "message": "Quality Event Register API is running",
  "status": "success",
  "version": "0.1.0"
}
```

Evidence and traceability

See **API-TC-001-Swagger-Evidence.pdf**: E1 identifies the API and route; E2 shows HTTP 200, the JSON body and response headers. The response Date header is **17 Oct 2026, 02:30:41 GMT** (Oct 16, 10:30:41 p.m. EDT). Source images: image(20261017-023937).png and image(20261017-024300).png.

Conclusion

PASS for the home-endpoint smoke test. The evidence supports basic API availability and response inspection. Quality-event operations, persistence, error handling, security and performance were outside this test. This is an educational portfolio record, not a regulated-system validation or an independent certification.
